# BALI STARLING

The Bali Starling (*Leucopsar rothschildi*) is a medium-sized warbler, about 25 cm long, from the Sturnidae tribe. He is also known as Curik Instead of Starling. The Bali Starling is only found in the forests of the western part of Bali Island and is endemic to Indonesia. This bird is also the only species endemic to Bali and in 1991 was named the fauna symbol of Bali Province. The Bali Starling was first discovered in 1910.

# JAVANESE SPARROW

The Javanese sparrow or *Padda oryzivora* is a small warbler bird with a length of about 15 cm from the Estrildidae tribe. The Javanese sparrow has a black head, white cheeks and a large red beak. Adults have gray fur, reddish-brown bellies, pink legs and red circles around their eyes. Male and female birds are similar. Young birds are brown.

This bird is endemic to Indonesia and is found in nature in grassland forests, rice fields and agricultural land on the islands of Java and Bali. Today, this species is known in many countries of the world as a decorative bird

# SUMATRAN TIGER

The Sumatran tiger is only found on the island of Sumatra. These big cats can live anywhere from lowland forests to mountain forests, and live in many unprotected places. Only about 400 individuals live in nature reserves and national parks, and the rest are scattered in other areas that are logged for agriculture, there are also approximately 250 individuals kept in zoos around the world. The Sumatran tiger is threatened with habitat loss due to its distribution area.

# KOMODO DRAGONS

Komodo dragons or complete Komodo dragons (*Varanus komodoensis*), are a species of large monitor lizards found on the islands of Komodo, Rinca, Flores, Gili Motang and Gili Dasami in East Nusa Tenggara Province, Indonesia. Another name for the Komodo dragon is the land crocodile, although the Komodo dragon is not a species of crocodile

Their massive body and terrible reputation have made them one of the most famous animals in the world.

# SUMATRAN RHINOS

The Sumatran rhinoceros, also known as the hairy rhinoceros or Asian two-horned rhinoceros, is an endangered species in the Rhinocerotidae family and one of five surviving rhino species. The Sumatran rhinoceros is the only remaining species of the genus *Dicerorhinus*.

The number of Sumatran rhinos is difficult to determine because they are solitary animals and are widely distributed, but it can be estimated that the number is less than 100 individuals.

# CROCODILES

Crocodiles generally inhabit freshwater habitats such as rivers, lakes, swamps and other wetlands. However, there are also those who live in brackish water such as estuarine crocodiles. Crocodile's main food is vertebrates such as fish, reptiles and mammals, sometimes it also preys on mollusks and crustaceans depending on the species. Crocodiles are ancient animals, which have changed little due to evolution since the time of the dinosaurs.
